ABSTRACTED-PUB-NO: JP 68020265B

BASIC-ABSTRACT:

Shaped polyamide articles are conjugate spun from a polyamide dyes with a 1,2 type metal complex salt dye as the core and a non-dyes polyamide as sheath.

The 1,2 metal complex salt dye has the general formula where R<sub>1,2,3,4</sub> are H, -R, -SO<sub>2</sub>CH<sub>3</sub>, -NHCOR<sub>1</sub> -NR<sub>2</sub> or halogen. R = alkyl group. M is transition metal and A is residual benzene or naphthalene group.

TITLE-TERMS: POLYAMIDE ARTICLE METAL METAL COMPLEX SALT

TITLE: Geogrid composed of polyethylene  
terephthalate and  
polyolefin bicomponent fibers

----- KWIC -----

Brief Summary Text - BSTX (7):

U.S. Pat. No. 3,616,183 discloses sheath-core filaments preferably with a polyethylene terephthalate core and a copolyester sheath of ethylene terephthalate/polyoxyethylene terephthalate. After subjecting the sheath-core filaments to a dyeing procedure, a treatment removes the dyestuff from the sheath of the filaments so the lack of dye-fastness and the lack of light resistance normally associated with the presence of dyestuff in the material of which the sheath is composed is no longer a problem.
